A held-out evaluation protocol for small synthetic datasets

Bo Split

2020

Abstract

A fixed fraction of a synthetic set, drawn once and never used for fitting, is enough to compare two models honestly as long as the draw is seeded and the split is taken from the same ordered sequence every time. This paper is one of two written for a test fixture, never a paper anyone submitted anywhere.

1 Protocol

Generate every row from one seeded stream, in order; hold out the last fifth for evaluation only.
